

## **ABSTRACT**

A tool case device includes a retaining member attached to a base member of a case, one or more pockets attached to the case and each having an opening to receive a tool. The tool includes a pair of  
5 levers having a middle pivotal shaft, each of the levers includes a handle on one end and a tool member on the other end. Another retaining member is attached to the middle portion of the pocket, to selectively engage with the retaining member of the base member. The retaining members are located between the handles of the levers,  
10 to detachably retain the tool in the pocket, and may be quickly disengaged from each other when the tool is pulled out of the pocket.
